

CONSTRUCTION • CIVILS • HIGHWAYS • COMPOUNDS

The compound moves. The system moves with it.

Start with four cameras on one compound and add the next site to the same account. When the phase ends, the kit lifts to the next job and the cameras come back on the dashboard where you left them.

- ✓ Runs on solar and 4G where there is no mains power and no fibre.
- ✓ AI tells a person from a fox, and the operator talks down over the speaker.
- ✓ Every camera records on site, so a 4G drop loses nothing.

ONE ACCOUNT, EVERY PHASE

What the cameras do at each stage.

Your installer scopes the compound and quotes the kit. You run the same platform on a muddy compound as on a finished office block, with the same features on both.

MOBILISE

Cover before the hoarding goes up

A tower or a TetherBox on the cabin puts the compound, the plant store and the gate on camera the week you break ground.

LIVE BUILD

Nights and weekends watched

AI raises the people and vehicles that matter, the operator challenges them over the speaker, and the verified clip goes to your monitoring station.

HANDOVER

The record, then the next job

Export the time-lapse for the project file, then lift the kit to the next compound. No licence to transfer and no dashboard to rebuild.

Add a site to the account in about 15 minutes. On-box AI needs a TetherBox with a GPU or NPU, or a camera with the analytics built in.

Plant stays where you left it

A voice over the speaker ends most Sunday-night visits before anyone reaches the container, and the police get a verified clip when it does not.

90% fewer false alarms

Foxes, rain and a tarpaulin in the wind stop waking the duty manager, so the calls that do come through get answered.

Every site on one screen

Group by project, by region or by manager, and give each site team access to their own compound and nothing else.

WHAT A COMPOUND NORMALLY PUTS ON CAMERA

Site gate and delivery lane

Plant and tool store

Material laydown

Welfare and offices

Hoarding line

Fuel and generator

ISO 27001 and SOC 2 cloud

Records through internet outages

Unmetered events

Named-user audit

DEPLOYED BY TETHERX-CERTIFIED PARTNERS ON LIVE CONSTRUCTION AND HIGHWAYS PROJECTS

THE PROJECT RECORD

The same cameras answer the H&S question.

A near-miss, a damaged panel or a delivery dispute all come down to who can produce the footage that afternoon. Your site team bookmarks the moment and shares a link; nobody walks a USB stick back to the office.

-  Export a time-lapse of the build for the project file and the client.
-  Share a signed link with the principal contractor or the insurer, with an expiry you set.
-  The audit log names who watched it and when, years after the job closes.

NEAR MISS · LEVEL 2 SLAB

evidenced

Reported - operative struck by swinging load	14:06
Found - site manager scrubs to the minute	14:19
Bookmarked - clip pinned to the incident	14:21
Shared - signed link, expires in 7 days	14:24
Opened - principal contractor, logged	AUDITED

Eighteen minutes from the report to the principal contractor watching it.

ON THE COMPOUND

More than a camera on a pole.

No recorder to steal

Footage records to the TetherBox and to the cloud, so somebody lifting a camera or the cabin does not walk off with the evidence.

Who came through the gate

ANPR reads deliveries and subcontractor vehicles in and out, and the door readers on the welfare unit land on the same timeline.

No silent failure

A dead camera, a full disk or a SIM that stopped talking appears on the health page the day it happens.

Your data, your region

Footage stays in your region and every view and download is audited. UK and Australia built, with representatives in Canada and India.

TetherBox AI removes over 99% of false alarms. Out of hours it boxes each person, scores it and draws the track they walked. Your site manager opens three clips in the morning, not three hundred.

A 4G site does not need a big data plan

Everything records at full rate on the TetherBox, and you choose per camera what crosses the link. A best frame every five seconds costs about 4.5GB a camera a month, and event thumbnails about 150MB. Full video stays on the box to pull on demand.

Rather it was watched for you?

Keep the monitoring station you already use and feed it verified events with the video attached, or take the turn-key service: an operator verifies the alarm, talks down over the speaker and dispatches with the clip already in the hands of the responder.

30 days

Free trial on your first sites

2,000+

Sites running on the platform

70%

Fewer site visits to clear a fault

99.9%

Uptime target on the cloud platform

WORKS WITH THE CAMERAS AND TOWERS YOUR INSTALLER ALREADY DEPLOYS

HIKVISION

1,000+ integrations - any ONVIF / RTSP camera, solar and 4G towers, alarm panels over SIA / Contact ID, gate and door readers, and into the ARC you already use
