

SELF STORAGE · SINGLE-SITE · MULTI-SITE · UNMANNED

Nobody on site. The gate still lets the right tenant in.

A customer pulls up after hours. ANPR reads the plate and opens the gate, their swipe at the unit disarms only that zone, and the owner gets a snapshot of who went in.

No staff on site, no keypad dance, no false alarm - and every other unit stays armed the whole time.

THE UNMANNED-SITE WORKFLOW

Every access handled - with nobody on site.

The after-hours arrival that used to mean a keyholder call-out, start to finish - and nobody on site had to lift a finger.

A CUSTOMER ARRIVES AFTER HOURS

● live

02:14  ANPR reads a whitelisted plate - the gate opens.

02:14  Their swipe disarms only that zone - no false alarm.

02:14  The owner gets a snapshot of who went in.

02:15  **Logged against the named customer.** **AUTOMATIC**

BUILT FOR THE WAY SELF-STORAGE ACTUALLY RUNS

Open around the clock.

Tenants come and go around the clock, and the TetherBox lets each one in and re-arms behind them, every night of the year.

Cloud, camera by camera.

Record on site, and back up only the cameras worth the money, at the retention you set on each one.

Scales to a whole portfolio.

Phase site after site onto one platform, on your own budget cycle - no big-bang rollout.

The call-out pays the platform

Customers let themselves in automatically, and you verify the alerts that remain from your phone.

"My unit was emptied", resolved

Access events and corridor footage sit on one timeline, so an investigation is a search rather than an afternoon.

Recording carries on offline

Edge recording on the TetherBox - no blind spot on a remote site nobody is minding.

Named access audit

Records through internet outages

AES-256 encryption

ISO 27001 / SOC 2

TENANTS, UNITS AND THE AUDIT

Who rents what, who went where - one source of truth.

Manage every unit and tenant in TetherX, and every access, gate read and remote action is recorded on one timeline tied to the camera that saw it. Search the whole estate by name from one login.

-  Every unit, tenant and rental date managed in TetherX - occupancy at a glance.
-  Search by customer name across one site or every site - who entered, when, on what credential.
-  "Who was in unit 14 last Tuesday" comes back as a name, a time and a clip.

UNIT AUDIT · UNIT 132 named user

Tenant - J. Okafor	rented
Last entry - swipe, corridor C	09:02
Guest access - granted 2h	MANAGER
Disputed entry - clip attached	RESOLVED

Every unit lists who rents it and who entered, by name rather than card number.

WHAT A STORAGE OPERATOR ASKS AFTER THE SITE WALK

A paying tenant gets in. A non-payer does not.

ANPR on the entrance

Every vehicle in and out gets a plate read - whitelist, watchlist and blacklist cross-referenced to the camera.

Billing drives access

Synced from your storage software: a paying tenant gets in on arrival, and a non-payer is locked out automatically on the next sync.

Audio talk-down

"You are on a monitored site after hours." Most opportunists leave; the manager never sends anyone out.

Abandoned-unit evidence

Last entry, condition and what came out - the access history and footage build the auction evidence trail.

FROM A SINGLE YARD TO A PORTFOLIO

Several unmanned sites, one remote team.

Whole portfolio, watched from anywhere

Duty manager sees every gate; regional sees their cluster; a caretaker sees only their yard - each from any browser, no VPN per site.

Tailgating detection
COMING SOON

AI flags a second vehicle following a single authorised open - a named alert with the footage attached.

Cloud, on-prem or hybrid

Record on the TetherBox, in cloud, or both. AES-256 at rest, TLS 1.2+, ISO 27001 / SOC 2 infrastructure.

Keep the cameras & access kit

Add the barriers, readers and cameras already on the fence line - no rip-and-replace, no capital write-off.

WORKS WITH THE CAMERAS AND ACCESS KIT ALREADY ON SITE

1,000+ integrations, plus gate, keypad and per-unit access control - and any ONVIF camera, no rip-and-replace

SCOPE YOUR FACILITIES
